

## Top 3 reasons to invest in **CLOSED-LOOP QUALITY SYSTEMS**

Design, build, deliver, and service high-quality products for global markets faster and with more functionality, while lowering overall risk, streamlining quality processes and manufacturing operations management, consolidating document control and data, and ensuring regulatory compliance.

- **Poor quality is more expensive than long-term quality investments**
- **Patient outcomes improve when issues are resolved quickly**
- **Regulatory compliance and reducing risk is easier with total value chain visibility**

### **Poor quality costs you 2X more than investing in good quality**

Product failures create costs, no matter where they happen, but proactive prevention throughout quality assurance can reduce those costs. Especially in a competitive, regulated market, closed-loop quality management can provide the necessary advantage a manufacturer needs to market new products quickly — while ensuring no quality has been compromised.

### **Meet demand for safe, high-quality, innovative devices**

Loyal customers are created and retained through high-quality product experiences. Incorporating customer feedback in product development and across the entire product lifecycle allows teams to innovate product design and resolve customer complaints faster.

### **Regulatory compliance is simpler without information silos**

Achieving and maintaining compliance is easier when the information isn't difficult to track down. Closed-loop quality management methodologies helps teams manage cases, complaints and CAPAs more effectively, and ensures proper employee training and management of training records.

**Success Story |** Dual vial access device manufacturer Yukon Medical previously used legacy product quality systems that weren't scalable, and made training very difficult. Using closed-loop quality management, they were able to streamline quality management processes, stay compliant, and stay up-to-date on all customer issues and product changes within one enterprise system, rather than writing data down and typing them into siloed systems.
